

Horizon Routine Tracker (HRT)

Product Requirement Document (PRD) for Single-User Custom Implementation

Target Domain: firnastechnologies.com	Author: Anas Bakkar
UI Language: English (100%)	Target Stack: Next.js / Tailwind CSS / Supabase (or standalone optimized)
Start Cycle: June 2026	System Type: Private Single-User Dashboard

1. Executive Summary & Core Concept

Horizon Routine Tracker (HRT) is a highly personalized, single-user productivity and spiritual alignment web application. Designed to mimic the deep flexibility of Notion while maintaining the strict execution speed of a dedicated habit-tracking dashboard, HRT will be deployed exclusively on `firnastechnologies.com`.

The system serves a singular purpose: maintaining an uncompromised, high-performance daily streak across spiritual obligations, personal development goals, health practices, and operational management. The application UI must be entirely in **English**, utilizing a clean, distraction-free minimalist premium aesthetic with motivational visual rewards and gamified metrics.

2. Architectural Foundations & Hosting Scope

- **Single-User Isolation:** No public registration endpoint. The platform must implement secure static authentication for a single administrator/user profile.
- **Domain Integration:** Optimized to run as a standalone application or a dedicated subdomain path on `firnastechnologies.com`.
- **Data Persistent State:** All states, daily configurations, history grids, and financial logs must be tracked persistently, ensuring swift local caching for near-zero latency updates.

3. Time, Calendar & Dual-Dating Engine

The core framework operates on an advanced dual-calendar paradigm, ensuring every daily node maps to both secular and spiritual timelines simultaneously:

- **Primary Anchor:** Gregorian Calendar (Miladi Takvim) displayed prominently at the top of the interface.
- **Secondary Anchor:** Hijri Calendar (Hicri Takvim) rendered dynamically right next to or underneath the Gregorian date in a subtle, refined, smaller typography font.
- **Timeline Bound:** The database must generate operational monthly buckets starting from **June 2026**, spanning indefinitely forward with seamless lazy-loading pagination for future months.

4. Chronological Daily Task Blueprint (The Habit Loop)

Tasks are clustered to fit a high-performance morning-heavy routine. The dashboard must render items sequentially across four core structural blocks:

Time Block	Task Node & Technical UI Term	Tracking Mechanism & Mechanics
01. Morning Core (Dawn to Forenoon)	- Fajr Prayer (Fard & 2 Sunnah) - Morning Dhikr (Zikr Litany) - Quran Devotion (Daily Wird / Tilavet) - Intellectual Growth (Book Reading) - Physical Training (Workout/Sport) - Nutritional Fuel (Healthy Breakfast) - Horizon Sync (Day Planning) - Duha Prayer (Kuşluk Namazı)	High-energy morning block. Checkboxes for each atomic habit. <i>Quran & Horizon Sync</i> include text inputs for notes/ranges.
02. Midday & Afternoon	- Dhuhr Prayer (4 Sunnah, 4 Fard, 2 Sunnah) - Asr Prayer (4 Sunnah, 4 Fard)	Checkboxes. Hanefi prayer validations applied. High spatial cohesion for Sunnah/Fard grouping.
03. Dusk & Evening	- Evening Dhikr (Zikr Litany) - Maghrib Prayer (3 Fard, 2 Sunnah) - Isha Prayer (4 Sunnah, 4 Fard, 2 Sunnah) - Witr Prayer (3 Rakahs - Hanefi Wajib)	Checkboxes bounded within their respective prayer cards.
04. Night Closeout	- Mind Log (Daily Journaling) - FinFlow (Expense Tracker)	<i>Mind Log</i> provides a clean text block. <i>FinFlow</i> provides a numeric text input area.

5. Advanced UI Views & Structural Engineering

5.1 The Daily Focus View (Actionable Checklist)

This is the main interaction dashboard. It displays the active day's checklist organized in the chronological blocks defined in Section 4. Checking off a task triggers instantaneous, fluid visual confirmation.

- **High-Cohesion Prayer Units:** For example, the *Dhuhr Prayer* element must exist as a modular card containing separate checkmarks for "4 Rakah Sunnah", "4 Rakah Fard", and "2 Rakah Sunnah". This allows marking individual components or tapping a "Fully Completed" quick action.
- **FinFlow Module:** A dedicated, sleek quick-input component where entering a number immediately records the day's financial outlay (e.g., [\$ 45.00]) without needing to exit the screen.
- **Mind Log Box:** A clean writing environment using a minimal serif font, allowing quick summaries of the day's events.

5.2 The Monthly Performance Grid (Notion-Style Master View)

A comprehensive database grid mirroring the iconic Notion style, mapping out months beginning from June 2026.

- **Rows & Columns:** Each row represents a calendar day (displaying Gregorian + Hijri dates). Columns represent the core habits and tracking variables (Fajr, Dhuhr, Dhikr, Quran, Training, Journal, Total FinFlow, Daily Percent).
- **Visual Cell State:** Cells display an elegant icon or color-coded block depending on completion, making visual macro-trend analysis effortless.

6. Gamification, Streaks & Visual Reward System

The Perfection Streak Engine (Sayaç):

The core psychological driver of the app is the absolute day counter. When 100% of the non-negotiable daily elements (all prayers, Witr, Dhikr, Sync, and basic routines) are completed, the day is marked as "**Perfect Day**".

- **Continuous Streak Display:** A prominent global counter at the top of the interface displays the current consecutive "Perfect Day" streak (e.g., 🔥 14 Days Perfect).
- **Growth Records:** The tracker must record historical peak streaks (e.g., 🏆 Personal Best: 42 Days) to encourage continuous improvement.
- **Real-time Progress Ring:** A smooth SVG-based progress circle rings the current day's metric, changing color dynamically from warning red to neutral amber, and finally into a deep emerald green when perfect completion is reached.

7. Aesthetic & Visual Guideline Specifications

- **Color Palette:** Deep emerald green (#1b5e20, representing discipline and spiritual focus), slate gray backgrounds, with refined warm gold accents (#d4af37) highlighting active streaks.
- **Micro-Iconography:** Clean SVG icons or modern emojis integrated next to each task descriptor to facilitate quick cognitive mapping.
- **Responsive Design:** Fully responsive canvas optimized for desktop productivity and rapid mobile logging on the go.

8. Execution Directives for AI Generator (Antigravity Instruction)

System Implementation Rules:

1. Parse this requirement document in full before structural generation.
2. Generate the user interface strictly using **English text layouts** as explicitly mapped out in Section 4.
3. Build the core state architecture to compute daily completion percentages and streak increments automatically.
4. Provide the complete code blocks required to deploy this package instantly onto the target domain infrastructure.
